

ECCtreme™ ECA 4000

Fluoroplastic Resin

Product Information

Description

ECCtreme™ ECA¹ 4000 fluoroplastic resin is a new class of perfluoroplastic specifically designed for use in extreme applications requiring an operating temperature up to 300 °C (572 °F)² in combination with excellent electrical properties and/or chemical resistance. Chemours developed ECCtreme™ ECA 4000 fluoroplastic resin in response to industry demand for a melt-extrudable, high-temperature fluoroplastic resin for wire and cable applications. ECCtreme™ ECA 4000 fluoroplastic resin has been recognized as a 300 °C (572 °F) rated material per UL 746B2 by Underwriters Laboratories. Compared with ECCtreme™ ECA 3000 fluoroplastic resin, ECCtreme™ ECA 4000 fluoroplastic resin has a slightly higher melt-flow rate (MFR), making it ideal for constructions needing 2–10 mil (0.05–0.254 mm) of insulation.

ECCtreme™ ECA 4000 fluoroplastic resin can be melt-processed using standard high-temperature fluoroplastic equipment, at standard operating speeds, and possesses physical, electrical, and chemical properties characteristic of polytetrafluoroethylene (PTFE). Its features include:

- UL rated for 300 °C (572 °F)²
- High melting point of ~320 °C (608 °F)
- Excellent dielectric properties
- Excellent chemical and permeation resistance
- Broad wire processing window of operation

In addition, ECCtreme™ ECA 4000 fluoroplastic resin demonstrates enhanced properties (e.g., higher melting point, increased melt viscosity, improved stress crack resistance) when subjected to post-processing heat treatment as shown in Table 1. This effect, known as epitaxial co-crystallization (ECC), occurs when the resin is heated between 280–300 °C (536–572 °F) for a prolonged period.

Safety Precautions

WARNING! VAPORS CAN BE LIBERATED THAT MAY BE HAZARDOUS IF INHALED.

Before using ECCtreme™ ECA 4000 fluoroplastic resin, refer to the Safety Data Sheet and the latest edition of "The Guide to the Safe Handling of Fluoropolymer Resins," published by The Society of the Plastics Industry, Inc. (www.fluoropolymers.org) or by Plastics Europe (www.plasticseurope.org).

Open and use containers only in well-ventilated areas using local exhaust ventilation (LEV). Vapors and fumes liberated during hot processing of ECCtreme™ ECA 4000 fluoroplastic resin should be exhausted completely from the work area. Contamination of tobacco with these fluoroplastics must be avoided. Vapors and fumes liberated during hot processing that are not properly exhausted, or from smoking tobacco or cigarettes contaminated with ECCtreme™ ECA 4000 fluoroplastic resins, may cause flu-like symptoms, such as chills, fever, and sore throat. This may not occur until several hours after exposure and will typically pass within about 24 hr.

Mixtures with some finely divided metals, such as magnesium or aluminum, can be flammable or explosive under some conditions.

¹Epitaxial Co-Crystallized Alloy

²UL Yellow Card (E54681) for 300 °C (572 °F) rating is based on UL 746B testing; for wire and cable applications, 300 °C (572 °F) rating is referenced in UL 1581 and UL 758. Not a guarantee of performance; see section "Important Notice" on p. 4.

Storage and Handling

The properties of ECCtreme™ ECA 4000 fluoroplastic resin are not affected by storage time. Ambient storage conditions should be designed to avoid airborne contamination and water condensation on the resin when it is removed from containers.

Freight Classification

ECCtreme™ ECA 4000 fluoroplastic resin is classified as "Plastics, Materials, Pellets."

Packaging

ECCtreme™ ECA 4000 fluoroplastic resin is supplied in 25 kg, single layer, plastic bags.

Processing Guidelines

ECCtreme™ ECA 4000 fluoroplastic resin can be processed by conventional fluoroplastic melt extrusion processes. For wire and cable applications, the processing window is large; wire constructions from AWG 40 gauge to AWG 16 gauge with 2–10 mil of insulation have been produced. ECCtreme™ ECA 4000 fluoroplastic resin processes best in a typical tubing draw-down extrusion using the same temperature profile as other fluoroplastics. Corrosion-resistant metals should be used in contact with molten fluoroplastic resin. Extruder barrel should be long, relative to diameter, to provide residence time for heating the resin. For more detailed processing information, including recommended draw-down ratios (DDR), consult your Chemours representative.

Extrusion Equipment

ECCtreme™ ECA 4000 fluoroplastic resin is fabricated using the same melt-processing techniques as other thermoplastics. A brief description of the extrusion equipment used with ECCtreme™ ECA 4000 fluoroplastic resins is given here; for more detailed processing information, consult the Chemours bulletin "Teflon™/Tefzel™ Melt Extrusion Guide," which can be obtained from your Chemours representative. Molten fluoroplastic resins are corrosive to many metals; therefore, special corrosion-resistant materials must be used for all parts of extrusion equipment that come into contact with the melt. Corrosion is likely to occur if dead spots exist in the equipment, processing temperatures are too high, or hold-up time is too long. In addition, resin degradation

will accelerate corrosion. Nickel-based alloys, such as Hastelloy³, Inconel⁴, Monel⁴, and Xaloy⁵, are the materials of choice. Hardened nickel plate can be used, but even small holes, chips, or cracks in the plating can compromise its performance. Chrome-plated materials are not recommended. Additional information on materials of construction can be obtained from your Chemours representative. Extruder barrels should be long, relative to diameter, to provide residence time for heating the resin to approximately 390 °C (730 °F). A 0.75–2.0 inch extruder with a barrel length to diameter ratio of 24:1 or higher is recommended for larger diameter extruders and 30:1 for smaller diameter extruders extruding ECCtreme™ ECA 4000 fluoroplastic resins. Extruder barrels should have three to five independently controlled heater zones with temperature controllers capable of accurate operation (± 0.6 °C [± 1 °F]) in the temperature range of 316–425 °C (600–800 °F). Heaters should be made of cast bronze or aluminum. Controllers with proportional-integral-derivative (PID) action or equivalent are recommended. A melt thermocouple and melt pressure probe should be installed in the adapter section of the extruder. To obtain an accurate measurement, the thermocouple should protrude into the melt flow sufficient to measure its temperature, not the metal surrounding it. Degradation of the resin during processing greatly reduces the performance of ECCtreme™ ECA 4000 fluoroplastic resins in stringent applications. Degradation is caused by excessively high melt temperatures, long residence time in the extruder, and/or excessive shear from the screw. In general, increases in the MFR greater than 10% during extrusion should be avoided. Other processing conditions that can reduce the resin's performance include melt fracture, very low or uneven melt temperatures, and the presence of hydrocarbon or silicone oils, which act as stress-crack promoters. It is strongly recommended that an ECCtreme™ ECA 4000 fluoroplastic resin-based color concentrate be selected for custom-colored applications. Use of alternative materials in the color concentrate could result in a reduction in the physical properties of ECCtreme™ ECA 4000 fluoroplastic resin, as well as decreased processibility.

High-Speed Wire Coating Techniques

Considerable experimentation has gone into the development of ECCtreme™ ECA 4000 fluoroplastic resins. This work has resulted in a resin that when processed within the recommended processing parameters will give a reliable, consistent manufacturing process for insulating wire. ECCtreme™ ECA 4000 fluoroplastic resin is applied as a wire insulation using

tubing extrusion techniques. It can be extruded using a wide range of DDRs; however, high draw-downs generally offer more favorable processing conditions. The draw ratio balance (DRB) should be in the range of 1.04–1.08. There is a complete discussion of DDR and DRB, including how they can be calculated, in the Chemours bulletin, “Teflon™/Tefzel™ Melt Extrusion Guide.” The melt temperature of the extrudate is critically important to the wire coating

Table 1: Typical Property Data for ECCtreme™ ECA 4000 Fluoroplastic Resin

Property	Test Method		Unit	Typical Value	
Upper Continuous Use Temperature ¹	UL 746B		°C (°F)	300 (572)

Note: Typical properties are not suitable for specification purposes.

¹Upper continuous use temperature is based on UL 746B testing; see UL E54681.

²Typical heat treatment indicates 7 days at 300 °C (572 °F).

³Depending on fabrication conditions.

⁴Historical standard.

⁵These results are based on laboratory tests under controlled conditions and do not reflect performance under actual fire conditions; current rating is a typical theoretical value.

process. Melt temperature cannot be reliably predicted by temperature profiles, as it will also vary with throughput. Melt temperature should be independently measured by an in-stream probe at the adapter or some other proven reliable means. An electronic wire preheater (or in-line wire draw annealer), located as close to the crosshead as possible, is recommended for preheating the wire to 105–176 °C (220–350 °F). A controlled vacuum is required at the rear of the crosshead to adjust the melt cone to the desired length. Experiments have shown cone lengths from 25–57 mm (1.0–2.25 in) yield satisfactory results with 80–100 DDR. Stationary pulleys should be located on both sides of the crosshead to reduce wire flutter. The wire should pass through the crosshead without touching the inside of the head or the extrusion tooling. Consideration should be given to the use of a short, hot water bath at the extruder end of the trough. Processing conditions will depend on the equipment used, the product being made, and the production rates needed. Further guidance is available from your Chemours representative.

IMPORTANT NOTICE

ECCtreme™ ECA 4000 fluoroplastic resin is a new product targeting extreme applications that require properties beyond the operating limits of typical perfluoroplastics. As a result, the performance characteristics and other properties of this product are not guaranteed, and the User is responsible for evaluating and determining whether this Chemours product is suitable and appropriate for a particular use and intended application. The conditions of evaluation, selection, and use of the Chemours product can vary widely and affect the use and intended application of the Chemours product. Because many of these conditions are uniquely within the User's knowledge and control, User must evaluate and determine whether the Chemours product is suitable and appropriate for a particular use and intended application.

CAUTION: Do not use Chemours materials in medical applications involving permanent implantation in the human body or contact with bodily fluids or tissues, unless the material has been provided from Chemours under a written contract that is consistent with Chemours policy regarding medical applications and expressly acknowledges the contemplated use. For further information, please contact your Chemours representative. You may also visit www.teflon.com/industrial to download a copy of the "Chemours POLICY Regarding Medical Applications" and "Chemours CAUTION Regarding Medical Applications." For medical emergencies, spills, or other critical situations, call (866) 595-1473 within the United States. For those outside of the United States, call (302) 773-2000.

The information set forth herein is furnished free of charge and based on technical data that Chemours believes to be reliable. It is intended for use by persons having technical skill, at their own discretion and risk. The handling precaution information contained herein is given with the understanding that those using it will satisfy themselves that their particular conditions of use present no health or safety hazards. Because conditions of product use are outside our control, Chemours makes no warranties, express or implied, and assumes no liability in connection with any use of this information. As with any material, evaluation of any compound under end-use conditions prior to specification is essential. Nothing herein is to be taken as a license to operate under or a recommendation to infringe any patents.

NO PART OF THIS MATERIAL MAY BE REPRODUCED, STORED IN A RETRIEVAL SYSTEM OR TRANSMITTED IN ANY FORM OR BY ANY MEANS ELECTRONIC, MECHANICAL, PHOTOCOPYING, RECORDING OR OTHERWISE WITHOUT THE PRIOR WRITTEN PERMISSION OF CHEMOURS.
